Summary

Senior Software Engineer with production ownership across Go distributed systems, Node.js backends, TypeScript/React/Vue/Svelte frontends, and AWS cloud infrastructure. Full-stack, with architectural depth on both sides. Lead frontend engineering at Unergy (4+ engineers), having refactored a high-debt codebase and standardized a Vue + TypeScript component library across all company applications. Previously technical lead on a Go SaaS that scaled to 1,000+ active users, built around a multi-model AI pipeline as its core differentiator, and separately, technical lead for 4+ critical systems at Universidad Nacional de Colombia, including a platform that cut a 2-week admin cycle to 20 minutes. Define scalable architectures, establish engineering standards, and raise the code quality bar through technical mentorship and cultivating engineering maturity. 10+ systems built from scratch and shipped to production.

Experience

Lead Frontend Engineer

Unergy | Feb 2026 - Present

Lead frontend engineering at Unergy, a solar energy company, owning architecture and delivery for the platform that manages the company's solar mini-farm project lifecycle end-to-end. Returned to this senior role after an initial engagement as Frontend Developer, an expanded mandate that reflected strong prior performance.

- Lead a frontend team of 4 engineers and own all frontend architecture decisions, establishing code review standards and decision-record practices that didn't previously exist, lifting sprint velocity by 30%
- Architected and shipped a Vue + TypeScript component library, code templates, and reusable foundations standardized across all of Unergy's applications, cutting time-to-ship for new features by 20% and setup time for new projects from days to hours.
- Inherited a frontend codebase carrying significant technical debt, led a structural refactor across 6 core modules reducing bundle size and initial load times by 25%, lowering infrastructure costs, and restructuring module boundaries to cut iteration time for the engineering team.
- Shipped 4 new internal and public-facing products beyond the core platform while continuing to scale the flagship system in parallel, leading a progressive, module-by-module migration from Vue to Svelte, backed by dedicated test coverage (Vitest, Playwright) to ensure zero regressions during the transition.

Lead Software Engineer & Technical Co-Founder

Butter | Jan 2025 - Jan 2026

Joined as founding engineer when the product was an idea. Sole technical owner across architecture, implementation, infrastructure, and production operations for an international content-generation SaaS. Taken from zero to 1,000+ active users.

- Architected and built the complete distributed system from zero, Go backend, async processing queues, PostgreSQL + Redis data layer, containerized AWS infrastructure, scaling the platform to 1,000+ active users internationally.
- Engineered the platform's core AI content-generation pipeline (multi-model LLM integration with model selection and cost/latency tradeoffs, FFmpeg multimedia processing, GPU workload scheduling), processing 2000+ jobs/day at ~2.4 min median processing latency as the product's primary technical differentiator.
- Operated the AI pipeline in production end-to-end, monitoring output quality, latency, and per-job cost, and iterating on models and processing strategy based on real usage.
- Implemented Stripe-based subscription billing and a multi-vendor marketplace with auditable, reconciliation-safe financial processing, an end-to-end payments system fully integrated into the core platform.
- Built full-stack observability from zero, Grafana dashboards, Prometheus alerting, structured incident response, sustaining 99.9% uptime and cutting incident detection time to under 5 minutes, without a dedicated DevOps function.

Founder & Lead Engineer

Independent/Kora Systems | Jan 2024 - Present

Founded and operate an engineering consultancy delivering production systems consistently built on a Go backend and React/Svelte frontend, with full technical and client accountability, from problem statement to unsupervised operation across 4 industries. (project-based, alongside full-time roles)

- Delivered 5 production systems across 4 client engagements spanning a venue-reservation marketplace, e-commerce platform, multi-tenant microsite system, and process-automation tooling, each shipped to full production with zero ongoing supervision required.
- Built LLM-powered agents across engagements, including a business due-diligence agent that combines token-cost optimization with human-in-the-loop verification, cutting the cost of a due-diligence run from millions of Colombian pesos to a few hundred while preserving reliability.
- Served as sole architect and technical lead on every engagement, directing development teams of 4+ engineers and translating ambiguous business requirements into concrete technical specifications, with complete documentation and continuity plans on every handoff.

- Maintained all 5 delivered systems in stable, active production 4+ months post-launch, proof of an engineering approach built for longevity, not just shipped features.

Senior Software Engineer

Asociación Colombiana de Universidades (ASCUN) | Nov 2025 - Feb 2026

Engaged as sole engineer by the Colombian Association of Universities (ASCUN), operating jointly with Colombia's Ministry of Education, to redesign and modernize a national gender-based-violence prevention and response platform end-to-end, with security and compliance held to a higher standard given the platform's institutional, government-linked nature.

- Redesigned a legacy Node.js backend for a government-linked GBV platform serving 64+ universities into a layered, concern-separated architecture, meeting the elevated compliance bar for sensitive citizen data and giving future contributors a documented, extensible API surface.
- Rewrote the frontend in React/TypeScript across 3 distinct product surfaces, a public institutional portal, an authenticated protocol-management app, and an internal backoffice, modernizing the experience for institutions across Colombia's national university network.
- Designed and built a conversational chatbot with an interactive map of Colombia for GBV (Gender-Based Violence) protocol navigation, extending institutional guidance to students and staff across 64+ universities for the first time.

Senior Software Engineer

Universidad Nacional de Colombia | Nov 2023 - Nov 2025

Full-stack software engineer (Go, React, Svelte) for mission-critical administrative systems at the Faculty of Engineering (Facultad de Minas), fully accountable from requirements through long-term maintenance.

- Architected and delivered a field-trip management platform that cut approval cycles from 2 weeks to 20 minutes, processing 200+ requests per semester and replacing a fully manual process with automated workflows.
- Engineered a real-time air-quality monitoring platform, continuous ingestion from multiple sensors, analytics dashboards, automated report export, meeting strict accuracy requirements for an active research lab's publishable data.
- Led development of an educational platform MVP featuring full course-module management and an integrated code-judge engine for automated programming assessments, reviewed and formally approved by the Faculty as a viable institutional tool.
- Led structured knowledge transfer on every project, architectural documentation, decision records, continuity plans, ensuring 4+ critical systems continued operating independently post-handoff.

Skills

- **Programming Languages:** Go, TypeScript, JavaScript
 - **AI / LLM:** Multi-model LLM integration, agents & assistants, prompt design, tool/function calling, structured outputs, streaming, production monitoring (quality, latency, cost)
 - **Frontend:** React, Svelte, Vue, Tailwind CSS
 - **Backend:** Gin, Node.js, REST API design, Microservices, Event-driven architecture, Message queues (RabbitMQ, Redis)
 - **Databases:** PostgreSQL, Redis
 - **Cloud & Infra:** Docker, AWS, Nginx, GitHub Actions, CI/CD
 - **Observability:** Grafana, Prometheus, Structured logging
 - **Also familiar with:** Python, MongoDB, SQL, Git, Vitest, Playwright, Kafka, Kubernetes, Terraform
-

Projects

Pegaso (Course Search & Schedule Builder) | SvelteKit, TypeScript, Go, PostgreSQL | pegaso.imlargo.dev

- Course scheduling and discovery platform for Universidad Nacional de Colombia, solving a multi-constraint enrollment problem at scale for a structurally complex student population.
- Scaled to **6,200+ active users** through entirely organic adoption. The university's subsequent official platform adopted its core design decisions, and the project prompted formal acquisition discussions with the institution, recognition at two levels.

Open Source Contributions | Go, Svelte, Gleam, TypeScript | [\(GitHub\)](#)

- Published webpush notification library for the Gleam ecosystem (hexdocs.pm/webpush), contributed new functionality and components to **shadcn/ui (Svelte + Vue ports)**, Svelte ecosystem libraries, and Gin.
- Contributor to ODPI Observatorio, a human rights data platform whose outputs are cited in **official UN Special Rapporteur reports**.

Medusa Framework | Go | [\(GitHub Repo\)](#)

- Open-source Go framework built around clean architecture principles, extracted from production patterns across multiple client systems and deployed back into those same environments, validating the abstractions under real constraints, not in isolation.

Education

B.Sc. in Software Engineering

Universidad Nacional de Colombia (Colombia's highest-ranked public university), 2024 - 2028 (part-time, working full-time since 2023)

Languages

- Spanish (Native)
- English (Professional Working Proficiency, EF SET Certificate 78/100)
